"Antigen distortion allows influenza virus to escape neutralization."
Nat. Struct. Biol. 5:119-123(1998).
-!- FUNCTION: HEMAGGLUTININ IS RESPONSIBLE FOR ATTACHING THE VIRUS TO CELL RECEPTORS AND FOR INITIATING INFECTION.
-!- SUBUNIT: HOMOTRIMER. EACH OF THE MONOMERS IS FORMED BY TWO CHAINS (HAI AND HA2) LINKED BY A DISULFIDE BOND.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This SWISS-PROT entry is copyright. C -!- FUNCTION: HEMAGGLUTININ IS RESPONSIBLE FOR ATTACHING THE VIRUS TO CELL RECEPTORS AND FOR INITIATING INPECTION (BY SIMILARITY).

C -!- SUBUNIT: HOMOTRIMER. EACH OF THE MONDMERS IS FORMED BY TWO CHAINS (H1 AND HAZ) LINKED BY A DISULFIDE BOND (BY SIMILARITY).

C -!- SIMILARITY: BELONGS TO THE INFLUENZA HEMAGGLUTININ FAMILY.

Submitted (JAN-2002) to the EMBL/GenBank/DDBJ databases.
-- FUNCTION: HEMAGGLUTININ IS RESPONSIBLE FOR ATTACHING THE VIRUS TO
CELL RECEPTORS AND FOR INITIATING INFECTION (BY SIMILARITY).
--- SUBUNIT: HOMOTRIMER. EACH OF THE MONOMERS IS FORMED BY TWO CHAINS
(HA1 AND HA2) LINKED BY A DISULFIDE BOND (BY SIMILARITY).
--- SIMILARITY: BELONGS TO THE INFLUENZA HEMAGGLUTININ FAMILY.

"The appearance of H3 influenza viruses in seals.";

"The appearance of H3 influenza viruses in seals.";

J. Gen. Virol. 76:199-203(1995)

-I- FUNCTION: HEMAGGLUTININ IS RESPONSIBLE FOR ATTACHING THE VIRUS

CELL RECEPTORS AND FOR INITIATING INFECTION (BY SIMILARITY).

-I- SUBUNIT: HOMOTRIMER. EACH OF THE MONOMERS IS FORMED BY TWO CHAI

(HA1 AND HA2) LINKED BY A DISULFIDE BOND (BY SIMILARITY).

-I- SIMILARITY: BELONGS TO THE INFLUENZA HEMAGGLUTININ FAMILY.

C -!- FUNCTION: HEMAGGLUTININ IS RESPONSIBLE FOR ATTACHING THE VIRUS TO CELL RECEPTORS AND FOR INITIATING INFECTION (BY SIMILARITY).

C -!- SUBUNIT: HOMOTRIMER. EACH OF THE MONOMERS IS FORMED BY TWO CHAINS

C -!- SIMILARITY: BELONGS TO THE INFLUENZA HEMAGGLUTININ FAMILY.

Title: Perfect score: SEQ10 38

Sequence: 1 siinfekl 8

Scoring table: BLOSUM62 Gapop 10.0 , Gapext 0.5

Searched: 283308 seqs, 96168682 residues

Total number of hits satisfying chosen parameters:

Minimum DB seq length: 0
Maximum DB seq length: 2000000000

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

Database : PIR 76:\*

2: pir2:\*
3: pir3:\*
4: pir4:\*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Cyclin B [imported] - Guillardia theta nucleomorph

C;Species: nucleomorph Guillardia theta

R;Note: a nucleomorph is the vestigial nucleus of a eukaryotic endosymbiont

C;Date: 10-May-2001 #sequence_revision 10-May-2001 #text_change 24-May-2001

C;Accession: A99989

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  seq length: 0

Nature 399:323-329(1999).

-i- FUNCTION: DNA POLYMERASE III IS A COMPLEX, MULTICHAIN ENZYME RESPONSIBLE FOR MOST OF THE REPLICATIVE SYNTHESIS IN BACTERIA.

THIS DNA POLYMERASE ALSO EXHIBITS 3' TO 5' EXONUCLEASE ACTIVITY.

THE ALPHA CHAIN IS THE DNA POLYMERASE (BY SIMILARITY).

-i- CAPALYTIC ACTIVITY: N deoxynucleoside triphosphate = N diphosphate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             between the Swiss Institute of Bioinformatics and the EMBL outstation the European Bioinformatics Institute.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SUBUNIT: DNA polymerase III contains a core (composed of alpha, epsilon and theta chains) that associates with a tau subunit. This core dimerizes to form the POLIII complex. PolIII associates with the gamma complex (composed of gamma, delta, delta', psi and chi chains) and with the beta chain to form the complete DNA polymerase III complex (By similarity).

SUBCELLULAR LOCATION: Cytoplasmic (By similarity).

SIMILARITY: BELONGS TO THE DNA POLYMERASE TYPE-C FAMILY. DNAE

J. Bacteriol. 183:4823-4838 (2001).

-!- FUNCTION: SbcCD cleaves DNA hairpin structures. These structures can inhibit DNA replication and are intermediates in certain DNA recombination reactions. The complex acts as a 3'->5' double strand exonuclease that can open hairpins. It also has a 5' single-strand endonuclease activity (By similarity).

-!- SUBUNIT: Heterodimer of sbcC and sbcD (By similarity).

-!- SIMILARITY: BELONGS TO THE SMC FAMILY. SBCC SUBFAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This SWISS-PROT entry is copyright.
